

Sprint 3 Plan

Goal: Create a more intuitive design and finish implementing functionality

User Story 1

As a user I would like to create and save workouts to a database and tie that to my schedule database and have both be displayed at the same time for the current user.

Task	Hours	Team
Save the user workout components to the firebase database and tie that with firebase authenticator for the current user.	10	CL
Display the schedule in order i.e. M before T, before W.	6	LL
Pull from the schedule database and the workout database simultaneously and tie them together by some key (email).	8	LL
Have the elements from the schedule database, and from the workout database be displayed together in a listView on the main page.	10	Team
Having the listViews refresh (when deleting an element) without having to change activities in order for them to do so.	4	LL

User Story 2

As a user I would like to edit my profile page

Task	Hours	Team
Create the add profile page with changeable fields, and be able to retrieve the information from them that were selected by the user on some "add" button (before storing into firebase). The fields should not all be EditTexts, but widgets that correspond to the type of component (makes retrieving data from them differently).	8	CL, LL
Add profile page elements that were retrieved from widgets on the "add" button to firebase database and tie them to firebase authenticator (name, height, weight, etc)	10	GC
Edit profile page elements on some page with editable fields,	10	WY

for editable components (load the previous data to show, that can then be altered) then stored into firebase, replacing the original entry.		
Getting rid of textbox if you tap on the screen away from it	6	WY
Have the ability to view your saved profile page elements on some page (that is tied to firebase authenticator for the currently logged in user).	10	AH
Save user information to database	10	AH
